

Latvian double glass modules

Ever wondered why solar panel manufacturers obsess over glass thickness? From durability to light transmission, the glass layer in photovoltaic modules plays a critical role that directly affects your ...

Excellent product appearance and performance Two-sided double-glazed modules, symmetrical structural design, low risk of hidden cracks.

Double-glass modules boast increased reliability, especially for utility scale PV projects. These include better resistance to higher temperatures, humidity and UV conditions and have better mechanical ...

In an era where energy efficiency isn't just a buzzword but a necessity, Latvian double glass modules have emerged as a game-changer. These modules, designed with two layers of tempered glass and ...

Our dual glass modules use the same internal circuit connection as a traditional glass-backsheet module but feature heat-strengthened glass on both sides. We produce the back glass with a unique drilling ...

Compared to traditional glass-backsheet modules, they offer greater durability and environmental resistance. The dual-glass structure provides enhanced protection for solar cells ...

Generally, the front and back glass layers in these modules have the same thickness, contributing to their balanced structural integrity. This design not only enhances the module's ...

Dual-glass type modules (also called double glass or glass-glass) are made up of two glass surfaces, on the front and on the rear with a thickness of 2.0 mm each.

Double-sided PV modules inherit all the advantages of mono PERC modules: high power density resulting in significant BOS savings, high energy yield with better performance in low light and lower ...

The application of double-glass modules covers multiple markets including utility, residential and commercial. To learn more, complete the form below to download the white paper.
